

Applications of Differentiation I

Page 1

Optimisation steps:

1. Draw a diagram, define variables.
2. Write the quantity to optimise.
3. Differentiate and find critical points.

Applications of Differentiation I Page 2

Kinematics:

$$v(t) = s'(t), \quad a(t) = v'(t) = s''(t).$$

$v = 0$ marks a change of direction.
